ABSTRACT

Safety driving is an advanced training ground that is more concerned with the safety of drivers and passengers. A safety job was appointed to increase awareness of all possible outcomes during driving. A safe job can be a result of several factors, such as the duration of the job, the *safety driving* training, the length of the job and the knowledge. *Safety driving* can cause accidents if they don't apply properly. The purpose of this study is to identify *safety driving* factors in truck drivers at PT. This type of research is quantitative, using a design of correlation research that USES the cross-sectional approach to learn about the factors associated with *safety driving* at truck drivers in PT. Studies show that according to a statistical test using chi square is knowledge of *safety driving* (p value 041) as there is a significant link between knowledge and safety, the work duration (p value = 0046) as there is a significant working duration with *safety driving*, long work time (p value = The *safety driving* training (p value = 1,000) is no significant link between the training and the *safety driving*.

Keywords : *Safety driving*, Knowledge *Safety driving*, work time, *Safety driving* training.
