Aging or becoming old is a state that occurs in human life. The aging process is a lifelong process, not just starting from a certain point in time, but beginning from the very start of life. The purpose of this research is to understand the factors that influence the knowledge of the elderly in the flagship program for the elderly at the Tunas Harapan integrated health post. This type of research is quantitative, and the research activities are conducted at the Tunas Harapan integrated health post in Pangkalan Kasai Belilas. The sampling technique used was Non-Probability sampling with the Total Sampling method, involving 44 respondents. The research results indicate that the majority of the respondents have low knowledge of the elderly flagship program, with 27 individuals (61.4%) falling into this category. The results of the Chi-square test showed a p-value of 0.002, which is less than 0.05, indicating a relationship between family support and the knowledge of the elderly in the senior program. The Chi-square test also yielded a p-value of 0.016, which is less than 0.05, suggesting a relationship between the attitudes of the elderly and their knowledge in the senior program. The findings of this study are expected to serve as a resource and be beneficial for future researchers, both at IKes Payung Negeri Pekanbaru and in other health institutions.
